About

DoJSON is a simple Pythonic JSON to JSON converter.

2 Chapter 1. About

CH	AP.	TF	R	_

Installation

DoJSON is on PyPI so all you need is:

\$ pip install dojson

# $\mathsf{CHAPTER}\,3$

Documentation

Documentation is readable at https://dojson.readthedocs.io/ or it can be built using Sphinx:

- \$ pip install dojson[docs]
  \$ python setup.py build\_sphinx

СН	ΔP	ΓFF	R 4
OI I	$\Delta$ I		1

Testing

Running the test suite is as simple as:

\$ python setup.py test

8 Chapter 4. Testing

# CHAPTER 5

Example

A simple example on how to convert MARCXML to JSON:

```
from dojson.contrib.marc21.utils import create_record, split_stream
from dojson.contrib.marc21 import marc21
[marc21.do(create_record(data)) for data in split_stream(open('/tmp/data.xml', 'r'))]
```

# **User's Guide**

This part of the documentation will show you how to get started in using DoJSON.

# **Usage**

DoJSON is a simple Pythonic JSON to JSON converter.

The main goal of this package is to help with managing a set of rules for manipulation of Python dictionaries with focus on JSON serialization. Each rule is associated with regular expression and key. The regular expression has to match a key in the source mapping and produces a new value that is added to the output mapping under the new key.

# Initialization

First create an Overdo object that is holding the index with rules.

```
>>> import dojson
>>> simple = dojson.Overdo()
```

Next step is to create rules that will manupulate a source object.

```
>>> @simple.over('first', '^.*st$')
... def first(self, key, value):
... return value + 1
```

```
>>> @simple.over('second', '^.*nd$')
... def second(self, key, value):
... return value + 2
```

And now we can try to match the source object and produce new data.

```
>>> data = simple.do({'1st': 1, '2nd': 2})
>>> assert 2 == data['first']
>>> assert 4 == data['second']
```

## **Command line interface**

Command line interface script is installed as dojson.

The easiest way to get started by applying already registered rule to a JSON data.

```
{"245__": {"a": "Test title"}}
```

DoJSON comes with set of rules for processing MARC21 fields.

```
$ echo '{"245__": {"a": "Test title"}}' | dojson do marc21 {"title_statement": {"title": "Test title"}}
```

Sometimes one can get input with fields that does not match any rule. To get such a list of fields one can use the missing command.

```
$ echo '{"999__": {"a": "Test title"}}' | dojson missing marc21
999__
```

The usual problem comes with reading different file formats such as XML.

You can specify regitered loader using -1 <NAME> argument. Save the above example as example.xml and check following command.

```
$ dojson -i example.xml -l marcxml do marc21
{"title_statement": {"title": "Test title"}}
```

In similar way it is possible to specify different output serializer (-d).

```
</record>
</collection>
```

# **Command chaining**

This makes JSON manipulation even easier. For first example see schema command that accept string argument containing URL of JSON-Schema that should be added to \$schema field.

```
$ dojson -i example.xml -l marcxml do marc21 \
schema http://example.org/schema/marc21.json
..."schema": "http://example.org/schema/marc21.json"...
```

Second example shows easy verification that rules produce an identity function.

```
$ dojson -l marcxml -d marcxml do marc21 do to_marc21 < example.xml | \
diff - example.xml</pre>
```

# **Extensibility**

New commands, loaders, dumpers, or rules can be provided via entry points.

- dojson.cli commands that return a processor acception an iterator;
- dojson.cli.load functions expecting a stream and returning Python dict or iterator;
- dojson.cli.dump functions expecting a Python object and returning str;
- dojson.cli.rule instances of dojson.overdo.Overdo with loaded rules.

# **API Reference**

If you are looking for information on a specific function, class or method, this part of the documentation is for you.

## API

```
Do JSON translation.
```

5.2. API Reference 11

Raises MissingRule when no rule matched and ignore\_missing is False.

#### **Parameters**

- blob dict-like object on which the matching rules are going to be applied.
- **ignore\_missing** Set to False if you prefer to raise an exception MissingRule for the first key that it is not matching any rule.
- **exception\_handlers** Give custom exception handlers to take care of non-standard codes that are installation specific.

Changed in version 1.0.0: ignore\_missing allows to specify if the function should raise an exception.

Changed in version 1.1.0: exception\_handlers allows to set custom handlers for non-standard MARC codes.

```
missing(blob)
```

Return keys with missing rules.

```
over (name, *source_tags)
```

Register creator rule.

#### **Errors**

Define all DoJSON exceptions.

```
exception dojson.errors.DoJSONException
```

Parent for all DoJSON exceptions.

New in version 1.0.0.

# exception dojson.errors.IgnoreItem

The corresponding item from the current iterable has been ignored.

New in version 1.3.0.

# exception dojson.errors.IgnoreKey

The corresponding key has been ignored.

New in version 0.2.0.

## exception do json.errors.MissingRule

Raise when no matching rule was found.

New in version 1.0.0.

#### CLI

Define chainable commands for processing loaded data.

```
dojson.cli.command.process_do = <click.core.Command object>
    Process data using given rule.
```

```
dojson.cli.command.process_missing = <click.core.Command object>
    List fields with missing rules.
```

```
dojson.cli.command.process_schema = <click.core.Command object>
    Add $schema to an item.
```

Utility function to manage CLI entry points

```
dojson.cli.utils.with_plugins(group_name)
    Register external CLI commands.
```

#### Contrib

There are set of rules to manage translation from other formats.

### MARC21

MARC standards based on www.loc.gov/marc/.

# **Additional Notes**

Notes on how to contribute, legal information and changes are here for the interested.

# Contributing

Bug reports, feature requests, and other contributions are welcome. If you find a demonstrable problem that is caused by the code of this library, please:

- 1. Search for already reported problems.
- 2. Check if the issue has been fixed or is still reproducible on the latest *master* branch.
- 3. Create an issue with a test case.

If you create a feature branch, you can run the tests to ensure everything is operating correctly:

```
$ python setup.py test
...
====== 31 passed, 23 skipped in 1.37 seconds ======
```

You can also test your feature branch using Docker:

```
$ docker-compose build
$ docker-compose run web python setup.py test
$ docker-compose run web python setup.py build_sphinx
$ docker-compose run web pydocstyle --match-dir='dojson'
```

# **Changes**

# Version 1.3.1 (released 2017-03-14):

# **Bug fixes**

• Removes duplicate fields in MARC 21 JSON Schemas (closes #189).

5.3. Additional Notes 13

# Version 1.3.0 (released 2017-02-14):

#### **New features**

- Adds the possibility to skip individual items when using the *for\_each\_value* decorator by raising the *IgnoreEle-ment* exception.
- Adds @flatten decorator that joins iterable results. (#147)
- Adds to\_marc21 conversion functions.

# Improved features

- Updates MARC21 schema and conversion functions to the latest Library of Congress standard.
- Clarifies in its docstring that *force\_list* may returns a tuple, not a list. (#154)
- Adds order to existing marc21 conversion functions.
- Updates authority schema with new fields and corrects some existing ones.

# **Bug fixes**

- Addresses issues with STDIN encoding on Python 3.
- Removes @utils.for\_each\_value decorator from conversion function for MARC21 field 044, which is not repeatable. (#181)
- Adds tuples to recogines types in reverse\_force\_list so it behaves correctly as an inverse fuction to force\_list.
- Adds missing default argument to <u>\_\_deepcopy\_\_</u> method on GroupableOrderedDict. (#167)
- Implements GroupableOrderedDict.\_\_repr\_\_() so that eval(repr(god)) == god. (#162)
- Removes invalid check for length of yielded value causing exception when value is dictionary with one item. (#150)
- Removes list definition from main\_entry\_uniform\_title as according to Library of Congress is a non repeatable field.
- Removes invalid subfield from *data/test\_7.xml*.

### Version 1.2.1 (released 2016-05-02):

#### Improved features

- Improves support for leader field conversion to and from MARC21 and adds JSON Schema for this field. (#133)
- Adds conversion support for *leader* field in authority records, as well as schema support.
- Adds support for dashes in keys. (#139)

# **Bug fixes**

- Fixes bug in string formatting, and pads integer fields with zeros (as per MARC standard).
- Removes list definition from main\_entry\_personal\_name as according to Library of Congress is a non repeatable field.

# Version 1.2.0 (released 2016-03-21):

# Incompatible changes

• Removes automatic wrapping to *<collection/>* for single record passed to *dumps\_etree*.

# Improved features

• Adds new argument to specify namespace prefix in generated MARCXML.

# Version 1.1.1 (released 2016-03-15):

# **Bug fixes**

• Adds missing schemas for fields bd388, bd370, bd348, bd884.

# Version 1.1.0 (released 2016-03-10):

### Incompatible changes

• Moves *-load* and *-dump* options to global group.

### **New features**

- Adds schema command to enhance JSON with '\$schema' field. (#73)
- Adds rules and schemas for MARC 21 Format for Authority Data. (#7)
- Adds rules and schemas for MARC 21 Format for Holdings Data. (#21)
- Adds support for parsing < leader/> tag in MARCXML.
- Adds new parameter *exception\_handlers* to dojson.Overdo.do and dojson.contrib.to\_marc21.model.Underdo.do. It can be given to the translation process to deal with non-standard fields in a custom way (#26).
- Adds new utility *map\_order* function to ease renaming of subfields.

### Improved features

- Adds more detailed usage examples. (#117)
- · Refactors CLI to allow commands chaining.
- Adds support preserving the order of subfields.

5.3. Additional Notes 15

# **Bug fixes**

• Fixes support for Python 3.5.1.

# Version 1.0.0 (released 2016-01-14):

# Incompatible changes

- Removes support for single key matching multiple rules. Please make your rules mutually exclusive!
- controlfields 00x are expected to be the element or a list of multiple elements.

## **New features**

- Adds new keyword argument *ignore\_missing* to *Overdo.do* method to specify if method should raise *Missin-gRule* exception when there is no matching rule for a key.
- Adds new CLI option –strict to the do command that sets the ignore\_missing argument to False. (#51)
- MARC XML serialization from to marc21.

# Improved features

- Adds support for Python 3+.
- Uses an OrderedDict to let the external tools working on dict (like json) behave correctly.
- All results from rules using *for\_each\_value* decorator are being automatically extended. This is useful for repeatable MARC21 fields with different indicators. (#53)
- Record are stored in an immutable sorted structure which enables to keep the intended order while offering easy ways to access, index and manipulate.
- Adds two records to be tested.
- Reorders some of the assertion: *expected* == *actual*.

# Version 0.4.0 (released 2015-11-18):

### **New features**

- Improves dojson.contrib.marc2.utils.load() to read the input by iterating of the open stream, rather than loading it all in memory in one go. (#45) (#46)
- Renames OverUndo to Underdo following same name convention as for Overdo.

## **Bug fixes**

• Fixes indicator extraction from value in *Underdo* model.

# Version 0.3.0 (released 2015-11-09):

#### **New features**

- Adds experimental rules for converting human readable JSON into a JSON representation of the MARC21 Format.
- Adds do and missing commands for dojson command line interface (see dojson -help for more information).

# Improved features

• Adds missing mapping for the first indicator of field 856.

# Version 0.2.0 (released 2015-10-07):

### **New features**

- Adds the posibility to use base DoJSON model so the rules are "inherited" from them.
- Adds new decorator *ignore\_value* that remove the key in the resulting json for None value.

# Improved features

• Uses entry points instead of plain imports to load the creator rules.

# **Bug fixes**

• Removes calls to PluginManager consider\_setuptools\_entrypoints() removed in PyTest 2.8.0.

# Version 0.1.1 (released 2015-07-27):

- · Sorts and removes duplicated enum values.
- Swaps wrongly defined repeatable and non-repeatable subfields. (#23)
- Addresses issue when allowed indicators where defined as a range. (#22)

# Version 0.1.0 (released 2015-07-03):

• Initial public release.
